Added Abstract Public API Methods..... 150

Introduction

This document provides important information for software developers about fixes, enhancements, and key features that are available in MYOB Advanced Business 2022.2.1. The document is designed particularly for those who customise MYOB Advanced Business ERP and develop applications for it.

Commerce Connector: API Changes

In MYOB Advanced Business 2022.2.1, multiple changes have been made in the API of the MYOB Advanced Business Commerce Framework. Developers that created commerce connectors for previous versions of MYOB Advanced Business need to update the code of the connectors, as described in this topic.

Removed Connector Descriptor Class

The connector descriptor class has been removed. The developer should move the implementation of the methods of the class as follows:

- The `GenerateLocalID` and `GenerateExternID` methods to the connector factory class. The default implementation of the `GenerateLocalID` method is available in the base connector factory class. For details about the connector factory class, see [Connector Factory Class](#).
- The `GetExternalFields` method to the connector class. For more information about this class, see [Connector Class](#).

Removed IProcessorsFactory Interface

The `IProcessorsFactory` interface has been removed. The developer should not implement any custom processor factory class. Instead of a custom processor factory class, the developer should use the predefined `PX.Commerce.Core.ProcessorFactory` class in the constructor of the connector factory class. The order of entities that was specified in the `IProcessorsFactory.GetProcessorTypes()` method in previous versions now should be specified in the `SortOrder` property of the `BCProcessor` attribute.

Changes to the BCProcessor Attribute

The `SortOrder` required property has been added to the `BCProcessor` attribute. The property defines the order of entities on the [Prepare Data](#) (BC501000), [Process Data](#) (BC501500), and other forms. In this order the system prepares and processes records. The developer can specify the same value for the property as the value that was returned by the removed `IProcessorsFactory.GetProcessorTypes()` method.

MYOB Advanced Business Commerce Framework now collects processor attributes from extensions.

Changes to the Connector Class

The `GetSchema` method has been removed from the connector class because the method was not used.

Support of Asynchronous Operations

Multiple changes have been made to support asynchronous operations in MYOB Advanced Business Commerce Framework. These changes may affect customisations that have been implemented by developers for prior versions of MYOB Advanced Business.

The following methods can now be executed asynchronously:

- For the connector class:
 - `ProcessHook`
 - `ProcessPush`
 - `Process`
- For the processor classes:
 - `Process`
 - `ProcessHook`
 - `ProcessPush`
 - `FetchBucketsImport`
 - `GetBucketForImport`
 - `MapBucketImport`
 - `SaveBucketImport`
 - `FetchBucketsExport`
 - `GetBucketForExport`
 - `MapBucketExport`
 - `SaveBucketExport`
 - `PullEntity`
 - `PullSimilar`
- For the `CBAPIService` class:
 - `GetAll`
 - `GetGIResult`

For the full list of changed methods, see Reference List of Changes in Release Notes for Developers.

The developer needs to modify the code of a custom commerce connector so that it supports asynchronous operations. An example of these changes is shown with bold type in the following code.

```

using System.Threading.Tasks;

public virtual async Task<ConnectorOperationResult>
Process(ConnectorOperation operation, int?[]
syncIDs = null, CancellationToken cancellationToken=
default)
{
    LogInfo(operation.LogScope(), BCMessages.LogConnectorStarted, NAME);

    EntityInfo info = GetEntities().FirstOrDefault(e =>
        e.EntityType == operation.EntityType);    using (IProcessor graph =
(IProcessor)CreateInstance(info.ProcessorType)    {
graph.Initialise(this, operation);                return await
graph.Process(syncIDs, cancellationToken);    }
}

```

The `CancellationToken` propagates a notification that the operation should be cancelled. We recommend that the developer pass the cancellation token in every method that supports it, such as in the methods that retrieve data from an external system.

Customisation: Independent Publishing and Unpublishing of Customisation Projects for the Self-Service Portal |

Customisation: Independent Publishing and Unpublishing of Customisation Projects for the Self-Service Portal

In previous versions of MYOB Advanced Business, when a customisation project was published on the Self-Service Portal, the customisation items of this project were shared with the MYOB Advanced Business instance because the Self-Service Portal shares a database with the MYOB Advanced Business instance. Thus, if projects published for MYOB Advanced Business and the Self-Service Portal contained customisation items of the same type (particularly, components of a workflow), customisation items of this type could replace the existing ones.

Now customisation projects published on the Self-Service Portal are independent from the MYOB Advanced Business instance due to the addition of a new column to databases tables that store workflow customisation items. This column identifies whether the customisation item belongs to MYOB Advanced Business or to the Self-Service Portal.

Customisation: Publishing of a Customisation Project Using Web API

In MYOB Advanced Business 2022.2.1, a developer can publish and unpublish a customisation project via the web API. The new API gives developers the following capabilities:

- To import a customisation project
- To delete a customisation project
- To publish a customisation project for which the developer can do any of the following:
- Specify the tenant or tenants where the customisation project should be published: the current tenant, a list of tenants, or all tenants
- Apply changes only to the database and skip the update of the website
- Execute all database scripts included in the customisation project (the same as the **Publish with Cleanup** menu command in the Customisation Project Editor)
- Perform only validation of a customisation project
- To publish multiple customisation projects at once
- To unpublish all customisation projects
- To get the list of published customisation projects and all items in them

To send requests, a developer should use POST methods and the following URL.

```
http://<Acumatica ERP instance URL>/CustomizationApi/<method>
```

Using the API, a customisation project can be published to MYOB Advanced Business or to the Self-Service Portal, depending on where sign-in was performed before the start of the publication.

Example of Publishing a Customisation Project

The publication of a customisation project via the API is implemented asynchronously. To start the publication, a developer should use the `PublishBegin` method. As soon as the developer gets a successful response, they should start calling the `PublishEnd` method until it returns `"isCompleted": true`. To check whether the publishing was completed successfully, a developer can check for the `"isFailed": false` in the response to the `PublishEnd` method.

Without a call to the `PublishEnd` method, the publication cannot be completed. Once a publication has started, a logical lock occurs in the database that prevents multiple publications from running simultaneously on the same database.

Suppose that a developer needs to publish the *VisualWorkflow* and *Dashboards* projects. Further suppose that the *Dashboards* project is already imported in the instance. To publish the customisation projects by using the API, a developer should do the following:

1. Sign in to the instance. For details, see [Sign In to the Service](#).
2. Import the *VisualWorkflow* customisation project by using the `Import` method.

An example of the request body looks as follows.

```
{
  "projectLevel": 1,
  "isReplaceIfExists": true,
  "projectName": "VisualWorkflow",
  "projectDescription": "Workflow for Sales Orders form",
  "projectContentBase64": "UESDBBQAAAAAACauNVQAAA..."
}
```

The request above imports the *VisualWorkflow* project and replaces a project with the same name if one exists. The `projectContentBase64` parameter contains a zip file with a project in the Base64 format.

The response to the request looks as follows.

```
{
  "log":
    [
      {
        "timestamp": "2022-03-01T01:27:36.8487004Z",
        "logType": "information",
        "message": "Create new project: VisualWorkflow"
      }
    ]
}
```

3. Publish the customisation projects by using the `PublishBegin` method.

An example of the request body looks as follows.

```
{
  "isMergeWithExistingPackages": false,
  "isOnlyValidation": false,
  "isOnlyDbUpdates": false,
  "isReplayPreviouslyExecutedScripts": false,
  "projectNames": [ "VisualWorkflow", "Dashboards" ],
  "tenantMode": "Current"
}
```

The request above publishes the projects listed in the `projectNames` parameter in the tenant where the developer signed in. The publication should be performed without cleanup according to the `isReplayPreviouslyExecutedScripts` parameter.

The response to the request looks as follows.

```
{
  "log":
    [
      {
        "timestamp": "2022-05-12T08:02:21.0555556Z",
        "logType": "information",
        "message": "Publishing has started."
      }
    ]
}
```

4. Start calling the `PublishEnd` method without parameters to check whether the publication is completed.

The response indicating that the publication is completed looks as follows.

```
{
  "isCompleted": true,
  "isFailed": false,
  "log": [
    {
      "timestamp": "2022-05-18T11:20:04.187",
      "logType": "information",
      "message": "Copying the website C:\\Builds\\ErpProduct_22.103.0018.0116"
```

```

        \\Customization\\apicust3\\apicust3Validation\\apicust3Website"
    },
    {
      "timestamp": "2022-05-18T11:20:04.217",
      "logType": "information",
      "message": "Patching the file C:\\Builds\\ErpProduct_22.103.0018.0116
                  \\Customization\\apicust3\\apicust3Validation\\apicust3Website
                  \\CstPublished\\pages_so\\so301000.aspx"
    },
    {
      "timestamp": "2022-05-18T11:20:04.22",
      "logType": "information",
      "message": "Patching the file C:\\Builds\\ErpProduct_22.103.0018.0116
                  \\Customization\\apicust3\\apicust3Validation\\apicust3Website
                  \\CstPublished\\pages_so\\so301000.aspx.cs"
    },
    ...

    {
      "timestamp": "2022-05-18T11:21:19.91",
      "logType": "information",
      "message": "Sql Sql#xUpdatesDates(skipped, already applied)"
    },
    {
      "timestamp": "2022-05-18T11:21:19.94",
      "logType": "information",
      "message": "Updating website files"
    },
    {
      "timestamp": "2022-05-18T11:21:57.57",
      "logType": "information",
      "message": "The website has started."
    },
    {
      "timestamp": "2022-05-18T11:21:57.677",
      "logType": "information",
      "message": "Plug-in ExternalCarriersCstPlugIn"
    },
    {
      "timestamp": "2022-05-18T11:21:57.72",

```

```
"logType": "information",
"message": "Post updating the company Company"
},
{
"timestamp": "2022-05-18T11:21:57.727",
"logType": "information",
"message": "Updating the database"
},
{
"timestamp": "2022-05-18T11:21:57.737",
"logType": "information",
"message": "Actions#SO301000"
}
]
}
```

Developer Documentation: New Guides

In MYOB Advanced Business 2022.2.1, a developer can find new and reworked information in the following developer guides.

MYOB Advanced Business Unit Test Framework Guide

The [Unit Test Framework Guide](#) provides information about how to create unit tests for extension libraries that are used in customisation projects for MYOB Advanced Business. This guide explains how to use the MYOB Advanced Business Unit Test Framework for this purpose.

Barcode-Driven Engine Guide

With MYOB Advanced Business's barcode-driven engine, the developer can convert an MYOB Advanced Business form, which is operated via a mouse and keyboard, into a console-type experience for a barcode-driven form. A user interacts with this form mostly via text commands that the user enters into a special field of the form manually or by scanning a barcode. The barcode-driven form guides the user through a certain input route by showing input prompts. This consoletype experience is useful when it is necessary to simplify the work with a particular form to the level of sequential text inputs.

In the [Barcode-Driven Engine Guide](#), the developer can find information about how to customise existing MYOB Advanced Business forms that use the barcode-driven engine and how to implement custom barcode-driven forms.

Workflow API Guide

The [Workflow API Guide](#) describes how to develop a workflow by using the Workflow API. The topics in the guide are organised as activities that developers can perform by using the dataset from the *T220 Data Entry and Setup Forms* course. In addition to activities, the guide includes information about the following:

- Screen configuration
- The process of defining conditions
- The implementation and configuration of actions and action categories
- The configuration of field states
- The process of defining workflow states
- The implementation of workflow transitions
- The implementation of dialog boxes
- The implementation of workflow events and event handlers
- The customisation of a predefined workflow

Each concept contains lists of workflow API methods that can be used to configure the workflow element described in the concept.

Workflow UI Guide

The [Workflow UI Guide](#) describes how to work with workflows without the need to write code. The topics in the guide are organised as activities that users can perform by using the *U100* dataset. In addition to activities, the guide includes concepts that describe how to do the following:

- Use the tools that MYOB Advanced Business provides for workflow customisation
- Create custom workflows
- Create customised workflows
- Configure various elements in a workflow
- Test customisation projects that modify the workflows
- Upgrade customised workflows

Customisation Tool Reference Guide

The [Customisation Tool Reference](#) guide contains topics that describe the pages of the Customisation Project Editor and other customisation-related tools, such as the Customisation Menu and the Element Inspector.

Integration Development: Use of MYOB Advanced Business as an Identity Provider via OIDC

MYOB Advanced Business 2022.2.1 can be used as an identity provider via the OpenID Connect (OIDC) protocol. A client application that is registered at MYOB Advanced Business as having the *OpenID Connect* sign-in method uses the MYOB Advanced Business Sign-In page for authentication. During the first sign-in, the client application requests access to the user attributes; for the application to be signed in, a user must confirm the granting of access to these attributes.

On the [Connected Applications](#) (SM303010) form, support for OIDC has been added for the *Authorisation Code* and *Implicit* flows. Additionally, the *Hybrid* flow has been added, for which support for OIDC has been implemented. To use OIDC, a client application includes the *openid* value in the scope of a request.

The configuration of the OpenID protocol that is used by an MYOB Advanced Business website can be displayed by a request to the following URL: [*Acumatica ERP instance URL*]/*identity/well-known/openid-configuration*. In this request, [*Acumatica ERP instance URL*] stands for the URL of the MYOB Advanced Business website.

On the new **Claims** tab of the [Connected Applications](#) form, the check box should be selected in the **Active** column for the claims that will be included in the token in the response to the client application (when OIDC is used). By default, MYOB Advanced Business contains a set of claims and a set of scopes; each scope defines the claims that will be included in a response when the scope is specified in a request. These sets of scopes and claims can be redefined in a customisation project (a plug-in). If a plug-in is selected in the Summary area of the [Connected Applications](#) form, the claims that are defined in this plug-in are added to the table on the **Claims** tab; in this table, these claims are marked as belonging to the plug-in.

Figure: Claims tab

MYOB Advanced Business contains an active key pair for signing and validating tokens. On the new *OpenID Connection Preferences (SM303030)* form, a user can click the **Generate New Key** button to generate a new key pair. At the generation of a new key pair, the existing signing key is deactivated immediately, while either the existing validation key can be deactivated immediately, or a period for its deactivation can be specified.

Platform API: Dropped Support of Obsolete MYOB Advanced Business Framework Development Tools

In Version 2022.2.1, the following MYOB Advanced Business Framework development tools are not supported:

- Visual Web Designer for Visual Studio
- Data Access Class Generator in Visual Studio
- Layout Editor in Visual Studio
- A set of page templates in Visual Studio
- The MYOB Advanced Business Framework Configuration Wizard

These tools were a part of MYOB Advanced Business Framework product, which is no longer provided as a separate product and is unavailable for downloading for Version 2022.2.1.

Instead of the unsupported tools, a developer can use the following tools:

- The Customisation Project Editor

The developer can use the Customisation Project Editor to create customisation projects and generate and edit data access classes (DACs), graphs, and ASPX pages. To launch the editor, the developer uses the **Customisation** menu of any MYOB Advanced Business form or the [Customisation Projects](#) (SM204505) form.

- A collection of Visual Studio code snippets

The developer can generate the code of DACs, DAC fields, and graph event handlers with these code snippets. To find related information and download the code snippets, see the [CodeSnippets](#) repository on GitHub.

- Acuminator

With Acuminator, the developer can find common mistakes in MYOB Advanced Business Framework-based code, colourise and format business query language (BQL) statements, and review the structure of code files. To use Acuminator, install the Acuminator extension for Visual Studio. For details about Acuminator, see the [Acuminator](#) repository on GitHub.

Platform API: Optimisation of the PXSetup<Table> Implementation

The `PXSetup<Table>` generic class reads graphs' preferences from the database. In MYOB Advanced Business 2022.2.1, the implementation of this generic class has been optimised so that the preferences of graphs can be read more quickly.

Now for each type parameter `Table`, data is read from the database only once and then stored in a database slot (that is, in the cache). In all subsequent uses of the `PXSetup<Table>` generic class with this type parameter, the class reads data from the database slot, not from the database itself.

Platform API: Signature Capturing on Mobile

In Version 2022.2.1, MYOB Advanced Business Framework provides a new static method for capturing a user's signature on a mobile device and storing it in a PDF version of the report. The method is defined in the

`PX.Data.Api.Mobile.SignManager` namespace.

When a signed report is required, a developer calls the new method in the application business logic code, as shown in the following example. (In this example, `Document` is a data view of a graph.)

```
Document.View.Sign(file.UID, out signedReportUID)
```

When the method is called, the following things happen on the mobile device:

1. The mobile device displays the contents of the report whose file identifier is specified in the input parameter of the method. A user can review the contents by scrolling, panning, or zooming in on the report.
2. The user either declines to sign the report or signs the report by writing a signature on the device screen and providing their name.

Depending on the outcome, the method returns one of the following:

- `SignDialogResult.None`: The signing process was interrupted abnormally.
- `SignDialogResult.Rejected`: The user declined to sign the report.
- `SignDialogResult.Complete`: The user signed the report. The file identifier of the signed PDF is available in the output parameter of the method.

This method has no effect in the web version of MYOB Advanced Business.

Web Services: Introduction of the Default/22.200.001 Endpoint

In MYOB Advanced Business 2022.2.1, a new version of the *Default* endpoint has been introduced, which is *Default/22.200.001*.

E-Commerce-Related Functionality

All the functionality that is exposed in the *eCommerce/20.200.001* endpoint has been made available in the *Default/22.200.001* endpoint.

Project-Related Functionality: Workflow Actions

In the *Default/22.200.001* endpoint, many workflow actions of entities are mapped. Workflow actions are actions that change the state of an entity.

The following actions are mapped:

- **Hold, Activate, Complete, Suspend, and Cancel** (in the `Project` entity)
- **Hold** and **Remove Hold** (in the `ChangeOrder` entity)
- **Hold** and **Remove Hold** (in the `ProFormaInvoice` entity)
- **Hold, Activate, Complete, and Cancel** (in the `ProjectTask` entity)
- **Hold** and **Activate** (in the `ProjectTemplate` entity)

Project-Related Functionality: Added Mapping

In the *Default/22.200.001* endpoint, the *Labor Rates* (PM209900) screen (form) is mapped to the `LaborCostRate` entity.

Project-Related Functionality: Added Fields

In the *Default/22.200.001* endpoint, for the `ProjectGLAccount` and `ProjectTaskDefaultValues` entities, the `DefaultExpenseAccountID` and `DefaultExpenseSubID` fields are mapped to the `DefaultCostAccount` and `DefaultCostSubaccount` fields, respectively.

Also, for the `ChangeOrderCommitment` entity, the `POOrderType` field is mapped to the `POType` field.

Project-Related Functionality: Renamed Fields

In the *Default/22.200.001* endpoint, for the `Event`, `Task`, and `TimeEntry` entities, the date and time fields are mapped to the fields with the same name, without underscores, suffixes, or prefixes.

In the `ProjectTask` entity, the `Attribute` field has been renamed to `Attributes`.

Project-Related Functionality: Removed Fields and Entities

The following fields, which existed in the *Default/20.200.001* endpoint, do not exist in the *Default/22.200.001* endpoint:

- `OpenAmount` (for the `ChangeOrder.Commitments` entity)
- `ActualAmount`, `ActualQty`, `Completed`, `DraftInvoicesAmount`, `OriginalBudgetedAmount`, and `OriginalBudgetedQty` (for the `ChangeOrder.RevenueBudget` entity)

Also, the following entities do not exist in the *Default/22.200.001* endpoint:

- `AllocationRule`
- `CommonTask`
- `ProjectBilling`
- `ProjectBillingRules`

Distribution-Related Functionality: Renamed Fields

The following fields in the *Default/20.200.001* endpoint have been renamed in the *Default/22.200.001* endpoint:

- `FreightAmount` to `FreightPrice` (for the `Shipment` entity)
- `Freight` to `FreightPrice` (for the `SalesOrder.ShippingSettings` entity)

Web Services: Creation of a Shipment with Allocations and Package Contents in One Call

In MYOB Advanced Business 2022.2.1, a developer can use one REST API call to create a shipment with allocations and package contents.

For example, the following request creates a shipment for the *ABARTENDE* customer. The items to be shipped belong to the *S0006778* and *S0006779* sales orders. The items are picked from different locations and are packed into a large box.

```
PUT ?$expand=Details,Details/Allocations,Packages,Packages/PackageContents HTTP/1.1
Host: [<Acumatica ERP instance URL>]/entity/Default/22.200.001/Shipment
Accept: application/json
Content-Type: application/json
```

```

Web Services: Creation and Update of an Inventory Issue

In MYOB Advanced Business 2022.2.1, an inventory issue can be created and updated with REST API requests.

For example, the following request creates an inventory issue for the *AAMACHINE1* and *AACOMPUT01* items.

```
PUT ?$expand=Details,Details/Allocations HTTP/1.1
```

```
Host: [<Acumatica ERP instance URL>]/entity/Default/22.200.001/InventoryIssue
```

```
Accept: application/json
```

```
Content-Type: application/json
```

```
{
  "ControlAmount": { "value": 60800 },
  "ControlQty": { "value": 3 },
  "Date": { "value": "2022-05-26T00:00:00+03:00" },
  "Description": { "value": "Descr" },
  "Details": [
    {
      "Allocations": [
        {
          "InventoryID": { "value": "AAMACHINE1" },
          "Location": { "value": "R1S1" },
          "LotSerialNbr": { "value": "SRF000009" },
          "Qty": { "value": 1 },
```

```

        "UOM": { "value": "EA" }
    },
    {
        "InventoryID": { "value": "AAMACHINE1" },
        "Location": { "value": "R1S1" },
        "LotSerialNbr": { "value": "SRF000010" },
        "Qty": { "value": 1 },
        "SplitLineNumber": { "value": 6 },
        "UOM": { "value": "EA" }
    }
],
"Branch": { "value": "PRODWHOLE" },
"Description": {
    "value": "Injection molding machine - serial numbered"
},
"ExtCost": { "value": 40000 },
"ExtPrice": { "value": 60000 },
"InventoryID": { "value": "AAMACHINE1" },

"TotalAmount": { "value": 61600 },
"TotalCost": { "value": 40250 },
"TotalQty": { "value": 4 }
}

```

The following request releases the created inventory issue.

```

POST / HTTP/1.1
Host: [<Acumatica ERP instance URL>]/entity/Default/22.200.001/InventoryIssue/
ReleaseInventoryIssue
Accept: application/json
Content-Type: application/json

{
  "entity": {
    "ReferenceNbr": {
      "value": "<Inventory_issue_ID>"
    }
  }
}

```

Web Services: Creation of a Return Order

In MYOB Advanced Business 2022.2.1, a return order (that is, a return for credit) can be created with a REST API request.

For example, the following request creates a return for credit to return 10 units of the item listed in line 2 of the *AR010707* invoice, 11 units of the item listed in line 4 of the *AR010707* invoice, and all units of all items listed in the *AR010693* invoice.

```

PUT / HTTP/1.1
Host: [<Acumatica ERP instance URL>]/entity/Default/22.200.001/SalesOrder
Accept: application/json
Content-Type: application/json

{
  "BaseCurrencyID": { "value": "AUD" },
  "CustomerID": { "value": "AACUSTOMER" },
  "Description": { "value": "API" },
  "Details": [
    {
      "InvoiceType": { "value": "Invoice" },
      "InvoiceNbr": { "value": "AR010707" },
      "InvoiceLineNbr": { "value": "2" },
      "OrderQty": { "value": "10" }
    },
    {
      "InvoiceType": { "value": "Invoice" },
      "InvoiceNbr": { "value": "AR010707" },
      "InvoiceLineNbr": { "value": "4" },
      "OrderQty": { "value": "11" }
    },
    {
      "InvoiceType": { "value": "Invoice" },
      "InvoiceNbr": { "value": "AR010693" }
    }
  ],
  "LocationID": { "value": "MAIN" },
  "OrderType": { "value": "RC" }
}

```

Web Services: Creation of a Credit Memo

In MYOB Advanced Business 2022.2.1, a credit memo can be created with a REST API request.

For example, the following request creates a credit memo to return 10 units of the item listed in line 7 of the *AR008287* invoice, all units of the item listed in line 1 of the *AR008281* invoice, and all units of the item listed in the *AR008285* invoice.

```

PUT / HTTP/1.1
Host: [<Acumatica ERP instance URL>]/entity/Default/22.200.001/SalesInvoice
Accept: application/json
Content-Type: application/json

{
  "CreditHold": { "value": false },
  "Currency": { "value": "AUD" },
  "CustomerID": { "value": "AACUSTOMER" },
  "Details": [
    {
      "OrigInvLineNbr": { "value": 7 },
      "OrigInvNbr": { "value": "AR008287" },
      "OrigInvType": { "value": "Invoice" },
      "Qty": { "value": 10 }
    },
    {
      "OrigInvLineNbr": { "value": 1 },
      "OrigInvNbr": { "value": "AR008281" },
      "OrigInvType": { "value": "Invoice" }
    },
    {
      "OrigInvNbr": { "value": "AR008285" },
      "OrigInvType": { "value": "Invoice" }
    }
  ],
  "Project": { "value": "X" },
  "Type": { "value": "Credit Memo" }
}

```

Web Services: Retrieval of the Available Quantity of an Inventory Item

In the *Default/22.200.001* endpoint, the *InventoryQuantityAvailable* entity is mapped to the *Available Quantity by Inventory Item* (GI640590) generic inquiry. This generic inquiry is used to retrieve the quantity of the inventory item for which the inventory ID is specified and whose record is modified not before the specified date.

For example, the following request retrieves the quantity of the *AACOMPUT01* items, as long as the last modification date of the database record is not before June 7, 2016.

```

PUT ?$expand=Results HTTP/1.1
Host: [<Acumatica ERP instance URL>]/entity/Default/22.200.001/InventoryQuantityAvailable

```

```

Accept: application/json
Content-Type: application/json

{
  "InventoryID": {
    "value": "AALEGO500"
  },
  "LastModifiedDate": {
    "value": "6/7/2016"
  }
}

```

Web Services: Specification of Tax Details in Purchase Orders

In MYOB Advanced Business 2022.2.1, during the creation or update of a purchase order with a REST API request, the value of the `IsTaxValid` field of the `PurchaseOrder` entity is used to determine how the tax details are calculated.

If the `IsTaxValid` field is specified in the request body, its value is set to *true*, and an external tax zone is specified, then the tax details from the request body are used without modification and no other taxes are applied.

If the `IsTaxValid` field is specified in the request body, its value is set to *true*, and an internal tax zone is specified, then the tax details from the request body are compared to those calculated by the system. If the taxes specified in the request body are present among those calculated by the system, then the tax details from the request body are used without modification and no other taxes are applied. If there is a tax in the request body that is not present among those calculated by the system, the request execution fails.

If the `IsTaxValid` field is not specified in the request body or its value is not set to *true*, tax calculation is performed by the system.

For example, the following request can be used to create a purchase order. In this sample code, an external tax zone and two new tax codes are used; the tax amount is then calculated based on these tax codes.

```

PUT ?$expand=Details,TaxDetails HTTP/1.1
Host: [<Acumatica ERP instance URL>]/entity/Default/22.200.001/PurchaseOrder
Accept: application/json
Content-Type: application/json

{
  "BaseCurrencyID": { "value": "AUD" },
  "Branch": { "value": "PRODWHOLE" },
  "ControlTotal": { "value": 1102.50 },
  "CurrencyEffectiveDate": { "value": "2013-01-01T00:00:00+04:00" },

```

```

"CurrencyRate": { "value": 1 },
"CurrencyReciprocalRate": { "value": 1 },

"CurrencyID": { "value": "AUD" },
}
```

Web Services: Overriding of Values in the Item Warehouse Details

In MYOB Advanced Business 2022.2.1, during the specification of item warehouse details, fields can be marked as overridden and their new values can be set in one REST API call.

For example, in the details for the *AACOMPUT01* inventory item and the *WHOLESALE* warehouse, the following request marks the `InventorySubaccount`, `MaxQty`, `ReorderPoint`, and `SafetyStock` fields as overridden and specifies their new values.

```
PUT / HTTP/1.1
Host: [<Acumatica ERP instance URL>]/entity/Default/22.200.001/ItemWarehouse
Accept: application/json
Content-Type: application/json

{
  "InventoryID": { "value": "AACOMPUT01" },
  "InventorySubaccount": { "value": "WID000" },
  "MaxQty": { "value": 2222 },
  "MSRP": { "value": 600 },
  "OverrideInventoryAccountSubaccount": { "value": true },
  "OverrideMaxQty": { "value": true },
  "OverridePreferredVendor": { "value": false },
  "OverridePrice": { "value": false },
  "OverrideProductManager": { "value": false },
  "OverrideReorderPoint": { "value": true },
  "OverrideReplenishmentSettings": { "value": false },
  "OverrideSafetyStock": { "value": true },
  "OverrideStandardCost": { "value": false },
  "PreferredLocation": { "value": "MAIN" },
  "PreferredVendor": { "value": "ELEEASTCOM" },
  "ReorderPoint": { "value": 14 },
  "ReplenishmentClass": { "value": "PURCHASE" },
  "ReplenishmentMethod": { "value": "Min./Max." },
  "ReplenishmentSource": { "value": "Purchase" },
  "SafetyStock": { "value": 244 },
  "Seasonality": { "value": "NONE" },
  "ServiceLevel": { "value": 87 },
  "WarehouseID": { "value": "WHOLESALE" }
}
```

Web Services: Innovations in the Implementation of the REST API

In MYOB Advanced Business 2022.2.1, innovations have been introduced in the implementation of the REST API.

New Common Fields in REST Responses

Now every REST response body with payload has additional fields as follows:

- For every returned record that corresponds to a top-level entity, there is a `_links/self` field in the response. The value of this field is part of the URL of a GET request for the retrieval of this top-level entity by its ID. The same URL can be used in a DELETE request for the deletion of this entity.
- For every returned record, there is a `_links/files:put` field in the response. The value of this field is part of the URL template that must be used in a request for attaching a file to this record. This field is returned not only for top-level entities but also for detailed records, and so now files can be attached to detailed records as well.

Following is an example of the new fields in a response that returns a `Bill` entity.

```
"_links": {
  "self": "/SalesDemo/entity/Default/20.200.001/Bill/2b7001ab-7b00ed11-9e53-9828a61840c3",
  "files:put":
"/SalesDemo/entity/Default/20.200.001/files/PX.Objects.AP.APInvoiceEntry/Document/2b7001ab-7b00-ed11-9e53-9828a61840c3/{filename}"
}
```

Multiple Conditions for the Same Field in a Filter

Now a user can specify multiple conditions for the same field in a filter by using the AND and OR operators.

For example, a request with the following URL retrieves sales orders that have the `S0003731`, `S0003732`, or `S0003733` order number.

```
http://<Acumatica ERP instance URL>/entity/default/20.200.001/SalesOrder?$filter=OrderNbr eq 'S0003731' or OrderNbr eq 'S0003732' or OrderNbr eq 'S0003733'
```

Retrieval of All Localised Values of Multi-Language Fields

In MYOB Advanced Business 2022.2.1, a new way to retrieve multi-language fields has been introduced.

To retrieve all localised values of all requested fields, a developer only needs to add the

\$expand=Translations parameter to the request. For example, the following request can be used to retrieve all stock items that are registered in the system; during the execution of this request, all the field values with all available localisations are requested.

```
GET ?$expand=Translations HTTP/1.1
Host: [<Acumatica ERP instance URL>]/entity/Default/20.200.001/StockItem
Accept: application/json
Content-Type: application/json
```

In this request, [<Acumatica ERP instance URL>] should be replaced with the URL of the MYOB Advanced Business ERP instance to which the request is made.

Below is an example of the returned data.

```
[
  ...
  {
    "id": "8ecd4ca7-30d1-ec11-839d-085bd61190bc",
    ...
    "Description" : {
      "value": "Description in English",
      "Translations": {
        "en": "Description in English",
        "fr": "Description en français"
      }
    },
    ...
  },
  ...
]
```

Web Services: Update of Tax Details During Bill Creation or Update

In MYOB Advanced Business 2022.2.1, the following changes have been made to the functionality exposed by the

Default/20.200.001 endpoint: During the creation or update of a bill (through the use of the `Bill` entity) or invoice (through the use of the `Invoice` entity), the value of the `IsTaxValid` field determines how the tax details are calculated. If the `IsTaxValid` field is specified in the request body and its value is set to `true`, the tax details are copied from the request body. Otherwise, tax calculation is performed by the system.

For example, the following request creates or updates a bill and at the same time updates the details of the `G1SALES GST` tax, so that its taxable amount is set to `1000`, its tax amount is set to `150`, and its expense amount is set to `0`.

```
PUT ?$expand=TaxDetails HTTP/1.1
Host: [<Acumatica ERP instance URL>]/entity/Default/20.200.001/Bill
Accept: application/json
Content-Type: application/json

{
  ...
  "IsTaxValid": { "value": true },
  "TaxDetails": [
    {
      "TaxID": { "value": "G1SALES GST" },
      "TaxableAmount": { "value": 1000.0 },
      "TaxAmount": { "value": 100.0 },
      "ExpenseAmount": { "value": 0.0 }
    }
  ],
  ...
}
```

Workflow: Enhancements to the Workflow Engine

In MYOB Advanced Business 2022.2.1, several enhancements to the workflow engine have been implemented. A customiser can now do the following:

- In a workflow state, specify the default values for fields of non-primary DACs.
For details about how a developer can implement this functionality by using Workflow API, see [Specifying Default Values for Fields](#).
For details about how a customiser can implement this functionality by using the Customisation Project Editor, see [Specifying Default Values for All Fields](#).
- In a dialog box, obtain the values of a combo-box field from a source state or a target state of a transition where the dialog box is shown.

Obtaining values of a combo-box field from a target state cannot be used if multiple transitions can be performed for the same initial state depending on a condition, because in that case, the field values cannot be determined in advance.

For details about how a developer can implement this functionality by using Workflow API, see [Obtaining the Value of a Combo Box Field from a Source or Target State](#).

For details about how a customiser can implement this functionality by using the Customisation Project Editor, see [Obtaining Values for Drop-Down Lists from Target States or Source States of a Transition](#).

- In a dialog box, hide fields depending on a condition.

If all fields of a dialog box should be hidden and the dialog box does not contain fields which value is required and has no default value, the dialog box will not be displayed. In that case, a transition before which the dialog box is shown, is still performed.

For details about how a developer can implement this functionality by using Workflow API, see [Hiding Fields in a Dialog Box](#).

For details about how a customiser can implement this functionality by using the Customisation Project Editor, see [Hiding Fields in Dialog Boxes](#).

Workflow: Enhancements to the Customisation Project Editor

This section describes the enhancements to the workflow-related pages of the Customisation Project Editor that have been implemented in MYOB Advanced Business 2022.2.1.

Specifying Default Values for All Fields

In the previous versions of MYOB Advanced Business ERP, a customiser could specify default values for fields in only the initial state of the workflow. In Version 2022 R2, the customiser can specify the default values for all fields added to the customisation project.

On the Fields page of the Customisation Project Editor, the **Default Value** and **From Schema** columns have been added to the table (see the following screenshot). The customiser can enter the needed values for fields or select one of the values available in the database. The customiser can also use the Formula Editor to specify values that depend on the values of other fields (for example, *Type* or *Status*).

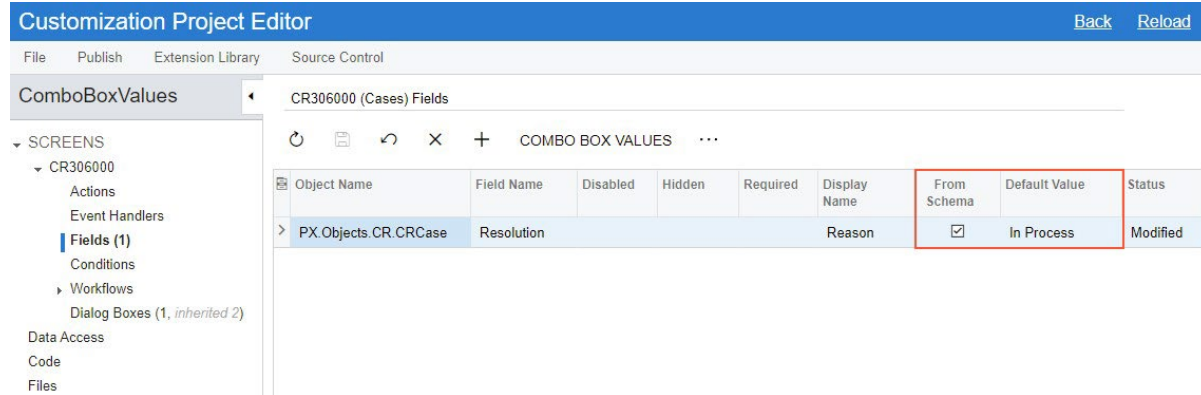

Figure: The Default Value and From Schema columns on the Fields page

Obtaining Values for Drop-Down Lists from Target States or Source States of a Transition

A customiser can select the source of values that will be available in dialog boxes that the system displays when a user invokes certain actions on a form. Instead of specifying drop-down values for each dialog box explicitly, the customiser can indicate that these values should be the same as in the target state or source state of the transition. This functionality allows the customiser to use only one dialog box for all actions in a workflow.

In the Customisation Project Editor, the customiser selects the source of values in the **Combo Box Values** dialog box. For a custom or customised workflow, the customiser opens this dialog box by clicking **Combo Box Values** on the table toolbar of the **Dialog Box Fields** table of the Dialog Boxes page.

In the **Source of Values** box of the dialog box, the customiser selects one of the following options (see the screenshot below):

- **Take From Source State:** The values from the source state of the transition are used. This is the default option for a new dialog box.
- **Take From Target State:** The values from the target state of the transition are used.
- **Specify Explicitly:** The values are selected in the table in the dialog box as they were in the previous versions of MYOB Advanced Business. This is the default option for an existing dialog box.

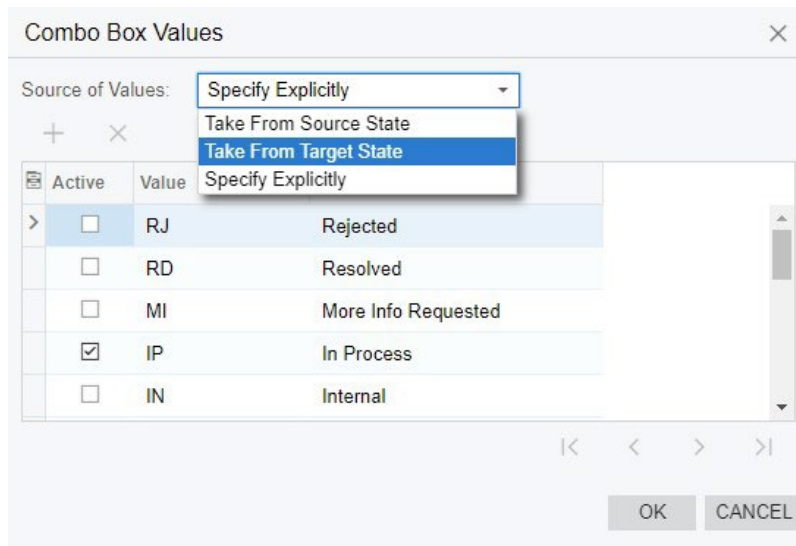

Figure: The Source of Values box of the Combo Box Values dialog box

If an action triggers transitions to multiple target states, we recommend that the customiser use the *Specify Explicitly* or *Take from Source State* option.

Hiding Fields in Dialog Boxes

A customiser can hide fields in dialog boxes depending on conditions.

In the **Dialog Box Fields** table of the Dialog Boxes page of the Customisation Project Editor, the **Hidden** column has been added (see the following screenshot). In this column, the customiser selects the conditions for particular fields; if these conditions are met, the fields are not displayed in the dialog box.

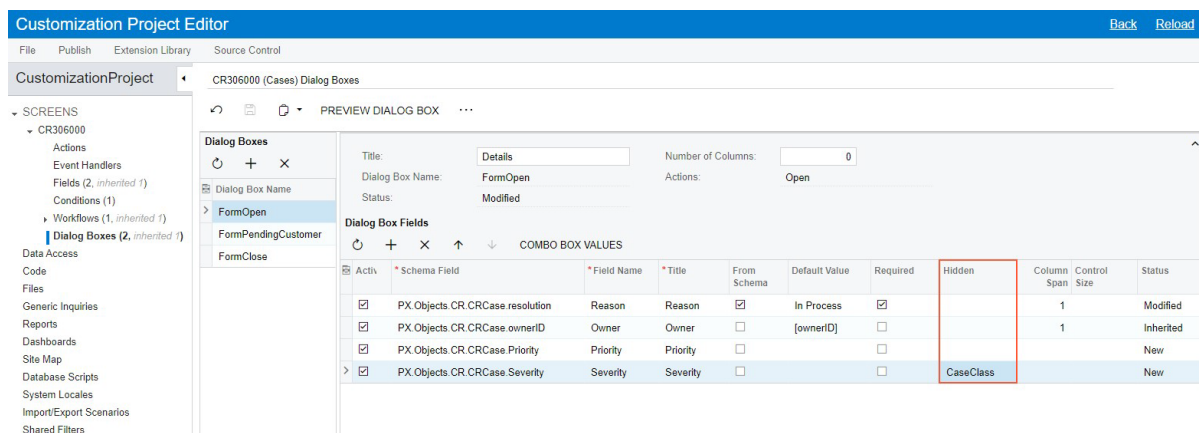

Figure: The Hidden column in the Dialog Box Fields table

If all fields of a dialog box are hidden, this dialog box is not displayed. If particular fields are hidden but have default values specified for them, these fields are not displayed in the dialog box; however, in the target state of the transition, these default values are assigned to the fields.

The customiser can also permanently hide a particular field in the dialog box by selecting *True* in the **Hidden** column for this field. This functionality can be useful if the field has been added in the

predefined workflow but is not required in the customised workflow; also, no additional workflow modifications are required in this case.

Workflow: Enhancements to Workflow API

This section describes the enhancements that have been implemented to Workflow API in MYOB Advanced Business 2022.2.1.

Specifying Default Values for Fields

In a screen configuration, a developer now has the ability to specify a default value for a DAC field. To do this, a developer can call one of the following methods while adding field states to the screen configuration in the

`WithFieldStates` method:

- `WithDefaultValue`
This method allows the developer to specify the exact value.
- `WithDefaultExpression`
This method allows the developer to provide a BQL expression that selects the proper value.

An example is shown in the following code.

```
context.AddScreenConfigurationFor(screen =>
{
    return screen
.StateIdentifierIs<CRCCase.status>()
    .AddDefaultFlow(DefaultCaseFlow)
    ...
    .WithFieldStates(fields => {
fields.Add<CRCCase.resolution>(field => field
.SetComboValues(
    (_reasonRejected, "Rejected"),
    (_reasonResolved, "Resolved"),
    ...
    (_reasonUnassigned, "Unassigned"),
    (_reasonAssigned, "Assigned"),
    (_reasonUpdated, "Updated"))
    .WithDefaultValue("Assigned"));
    })
});
```

In the code above, the `CRCCase.resolution` field is added to the screen configuration. The default value of the field is specified in the `WithDefaultValue` method.

If a field has combo box values, the default value should be one of the values listed in the `SetComboValues` method.

For more details on specifying default values for fields in a screen configuration, see [Field States: General Information](#).

Obtaining the Value of a Combo Box Field from a Source or Target State

In a workflow state, a developer can use the `WithFieldStates` method to specify the possible values of fields similarly to what is described in the previous section. In a dialog box, a developer can now specify that the set of values for a combo box field should be taken from a source state or a target state.

To specify that the set of combo box values of a dialog box field should be taken from a source or target state, while adding the field to a dialog box, the developer needs to call the `ComboBoxValuesSource` method and in a parameter, specify from where the values should be taken (a source state, a target state, or explicit values specified in the dialog box definition).

For example, suppose that in some state, a set of values for the `CRLead.resolution` field is specified. The workflow includes a transition where this state is a target state, and a dialog box that is shown during this transition. Further suppose that the dialog box includes the `Reason` field, whose configuration is provided by the `CRLead.resolution` field (through the developer's use of the `WithSchemaOf` method). To specify that the values of the `Reason` field should be taken from the target state of a transition where the dialog box is used, a developer should use the following code in the dialog box.

```
.WithForms(forms => {
forms.Add("FormOpen", form =>
form.WithFields(fields => {
fields.Add("Reason", field => field
.WithSchemaOf<CRLead.resolution>()

        .IsRequired()

        .Prompt("Reason")

        .ComboBoxValuesSource(ComboBoxValuesSource.TargetState));
}
));
});
```

For more details on configuring combo box values in a dialog box, see [Configuring Fields of a Dialog Box](#).

Hiding Fields in a Dialog Box

In a dialog box, developer now can hide a field depending on a condition. To do this, a developer should call the `IsHiddenWhen` method while adding a field to a dialog box in a screen configuration and specify a condition as a parameter.

The condition specified in the `IsHiddenWhen` method is not checked during mass processing of records.

Also, a developer can always hide a field by calling the `IsHiddenAlways` method. This method may be useful to hide a field in a dialog box of a custom workflow if this field is included in this dialog box in a predefined workflow.

An example is shown in the following code.

```
.WithForms(forms => {    forms.Update("FormOpen", form =>
form.WithFields(fields =>        {            fields.Add("Reason", field =>
field.WithSchemaOf<CROpportunity.resolution>()                .Prompt("Reason")
.IsHiddenWhen(hideReason));

        fields.Update("Stage", field => field.WithPrompt("Stage ID").IsHiddenAlways());
    }
    ));
})
```

In the code above, the `FormOpen` dialog box is updated in the following ways:

- The `Reason` field of the `FormOpen` dialog box is added and hidden when the `hideReason` condition is *True*.
- The `Stage` field is always hidden.

For more details on configuring field appearance in a dialog box, see [Configuring Fields of a Dialog Box](#).

Platform: Introduction of RabbitMQ for Internal Notification Queues

In MYOB Advanced Business 2022.2.1, we've made Rabbit MQ available, in preparation for the future deprecation of Microsoft Message Queuing (MSMQ) technology. This technology is supported in .NET Core and .NET 5.0. In a future update internal queues—such as the queues for push notifications, business events, and commerce notifications—will use the RabbitMQ service by default.

Installation and Update Notes

By default, during the deployment of a new version of MYOB Advanced Business or during the update of an instance through the use of the MYOB Advanced Business Configuration Wizard, MYOB Advanced Business can be configured to use RabbitMQ and a local file storage for the processing of internal queues.

If RabbitMQ is already installed in the environment, the MYOB Advanced Business Configuration Wizard does not install RabbitMQ; it configures MYOB Advanced Business to use RabbitMQ and a local file storage.

If the **Don't install RabbitMQ** check box is selected in the MYOB Advanced Business Configuration Wizard during the installation or update, RabbitMQ is not installed and MSMQ is used, as it was in previous versions of MYOB Advanced Business.

If the instance is updated through the web interface and the `web.config` file of the instance is not configured to use RabbitMQ, the instance continues to use MSMQ.

System Administration: Trace Improvements

MYOB Advanced Business 2022.2.1 introduces an improved Trace page. The improved page allows users and system administrators to view the following:

- All recent operations performed by the current user on a single page
- All messages, SQL statements, and exceptions logged in the system
- Logs that will be sent to MYOB Advanced Business
- Information about the system performance, even if the Request Profiler is turned off

The information on the page is preserved even after a user's session expires, and is limited by only the number of requests.

Users and system administrators access the Trace page the same way as they did before: by clicking **Tools > Trace** on the title bar of any MYOB Advanced Business form.

Trace Page Overview

The Trace page consists of the following parts, which are shown in the following screenshot and described in detail in the following sections.

- Header (see Item 1 in the screenshot)
- Table with recent requests (Item 2)
- Local environment section (Item 3)
- **Request** section with general information about the selected request (Item 4)
- Table with the logged information (Item 5)

The screenshot displays the Trace Page interface. It includes a header with the title 'Recent Requests' and a 'SUBMIT LOGS' button. Below the header is a table of recent requests with columns for Screen, Type, Command, Duration, Issues, and Time(UTC). To the right of the table is a 'Request' section showing details for a selected request, including Screen, Type, Command, Time, CompanyID, and Keys, along with Performance metrics like Server time, CPU time, SQL time, Wait time, SQL count, and SQL rows. Below the request details is a 'MESSAGES' section with tabs for 'MESSAGES (1)', 'SQL (9)', and 'EXCEPTIONS (4)'. The messages section shows an error message: 'Error: Inserting 'AR Transactions' record raised at least one error. Please review the errors.' At the bottom of the page is a local environment section showing user, version, and customization information.

Screen	Type	Command	Duration	Issues	Time(UTC)
SO303000	Screen	Save	274	1	2:12:25 PM
SO303000	Screen	FetchRow	520	0	2:12:23 PM
SO303000	Screen	Refresh	179	0	2:12:19 PM
SO303000	Screen	Refresh	195	0	2:12:15 PM
SO301000	Screen	ReloadPage	2 274	0	2:11:58 PM
SO3010PL	UI-GI	SyncGridPosition	1 180	0	2:11:57 PM

SO3010PL	UI-GI	NavigateToSSOOrder_orderNbr	271	0	2:11:57 PM
SO303000	Screen	Save	399	1	2:11:49 PM
SO303000	Screen	Save	268	1	2:11:41 PM

Request	Performance
Screen SO303000	Server time 275
Type Screen	CPU time 281
Command Save	SQL time 9
Time 2:12:25 PM	Wait time 0
CompanyID	SQL count 14
Keys DocType=INV,RefNbr=000113;	SQL rows 1

MESSAGES (1) SQL (9) EXCEPTIONS (4)

> Error Tue, 19 Jul 2022 14:12:26 GMT
Error: Inserting 'AR Transactions' record raised at least one error. Please review the errors.

User: gbbas@U100-HEADOFFICE Local Time: Tuesday, July 19, 2022 5:12:37 PM
Version: 22.193.0050.0008 UTC Time: Tuesday, July 19, 2022 2:12:37 PM
Customizations: None

Figure: The Trace Page

Header

The header contains the page title (**Recent Requests**) and the **Submit Logs** button. If an administrator clicks this button, the **Logs Submitted** pop-up window is displayed (see the following screenshot).

Technical details about the last actions have been submitted to Acumatica Inc. If you want to contact your Acumatica support provider about this log, save the following trace log ID:

1833a46b-0b59-4048-9c5b-6114623314c6 

Figure: The Logs Submitted pop-up window

In this pop-up window, the administrator can copy the trace log ID by clicking the Copy icon.

Recent Requests Table

This table displays information about the last ten requests performed by the user on all forms and in all dialog boxes and pop-up windows. The requests are grouped by operation and sorted by their **Time (UTC)**.

If a user clicks a request in the table, the detailed information about this request is displayed in the **Request** section and in the table with messages. This information includes the ID of the form on which the request was performed, the type of the request, the command that the user invoked, the duration of the request, the number of issues that occurred on the form, and the time when the request occurred.

Local Environment Section

This section contains the following information about the user's environment:

- **User:** The current user's name, the tenant, and the branch to which the user is signed in
- **Version:** MYOB Advanced Business version
- **Local Time:** Local time and date
- **UTC Time:** UTC time and date
- **Customisations:** The customisation project or projects that are published in the current MYOB Advanced Business instance

Request Section

The **Request** section contains the **Request** and **Performance** columns. The **Request** column duplicates the information displayed in the **Recent Requests** table for the selected request. In the **Performance** column, the user can see what resources the system used to process the request.

Table with Logged Information

In this table, a user can view information messages, SQL statements, and exceptions that have occurred in the system.

On the **Messages** tab of the table, the user views system messages, errors, and warnings. The displayed information depends on the type of request.

On the **SQL** tab, the user views the list of database tables involved in the request processing, the SQL statements that the system has generated, and the stack trace (see the following

screenshot). For each record on this tab, the user can see the total time spent on the request, the number of code executions, and the number of affected table rows.

MESSAGES (0) [SQL \(13\)](#) EXCEPTIONS (4)

On the **Exceptions** tab, the user views the exceptions that occurred in the system during the request selected in the **Recent Requests** table. The tab contains the name and type of the exception, the message, and the stack trace.

Upgrade Procedure: Customisations and Integrations

Multiple changes have been made since MYOB Advanced Business 2022.104 (Build 22.104.0012) that may affect reports, customisations, and integrations that have been implemented by developers for prior versions of

MYOB Advanced Business. The complete list of these changes is provided in [Reference List of Changes](#). The following sections describe additional recommendations about the possible approaches that a developer can use to prevent issues with the implemented solutions.

To prevent breaking changes in the customisations, the developer should do the following:

1. Analyse the customisation projects.
2. Carefully read the list of breaking changes in [Reference List of Changes](#).
3. Replace the changed objects with their alternatives.
4. If the objects used in the customisation projects have been removed and no alternatives have been provided, consider creating new customisation projects.

Before an upgrade to MYOB Advanced Business 2022.2.1, to detect the changes that break existing customisation projects, the developer can check the compatibility of the code included in all published customisation projects with the new code of MYOB Advanced Business. For details, see [To Validate the Compatibility of the Published Customisation with a New Version Before an Upgrade](#) in the Customisation Guide.

The validation that detects breaking changes is turned on by default in MYOB Advanced Business 2022 R2. If any errors occur during the validation, the developer can refer to [To Resolve an Issue Discovered During the Validation](#) in the Customisation Guide.

Update of the Search Index

During the upgrade, the search index may become outdated. To update the search index, a system administrator needs to rebuild the entity index after the database upgrade by doing the following:

1. Opening the [Rebuild Full-Text Entity Index](#) (SM209500) form.
2. On the form toolbar, clicking **Process All**.

This process rebuilds the content of the DACs available for search and stores it in the specific form prepared for search queries in the `SearchIndex` database table.

MYOB Advanced Business DLLs No Longer Signed

Starting in MYOB Advanced Business 2022.2.1, MYOB Advanced Business DLL files (which names start with PX) provided in the `Bin` folder of the instance are no longer signed. If a user gets an

error about assembly references while working on an instance with a customisation project published or while validating a customisation project, the extension library that is included in the customisation project should be recompiled.

Upgrade of Existing Customised Reports in the Accounts Receivables Functional Area

Because of the changes described in [Finance: Support of Multiple Base Currencies for the Dunning Process](#), developers may need to upgrade customised reports in the following ways:

- If a customised report explicitly uses the `ARSetup.ConsolidatedDunningLetter` field, this field should be replaced with the `ARSetup.PrepareDunningLetters` field. In the UI, the check box mapping the `ARSetup.ConsolidatedDunningLetter` field was replaced by a drop-down control that maps the `ARSetup.PrepareDunningLetters` field.
- If a customised report explicitly uses the `ARDunningLetter.Consolidated` field, this field should be replaced with the `ARDunningLetter.ConsolidationSettings` field.

EPShiftCodeRate	EPShiftCodeRate_PK	CuryID	New column added
MobileSiteMap	MobileSiteMap_PK	WebAppType	New column added

Code Changes

The following sections describe changes in the `PX.Common.*.dll`, `PX.Data.dll`, `PX.Objects.*.dll`, `PX.Commerce.Core.dll`,

`PX.Commerce.Objects.dll` and `SP.Objects.dll` libraries. This list also does not include any objects that are marked with the `PX.Common.PXInternalUseOnlyAttribute` or `PX.Data.PXProtectedAccess`. If nothing has been changed, added, or removed, the associated sections will not be displayed.

Description of Code Changes

This chapter contains detailed descriptions of important code changes, which are organised by area.

Finance

The ability to customise the adjustment of the tax calculation level calculation has been added. A developer can perform the customisation by overriding the `CAReleaseProcess.AdjustTaxCalculationLevelForNetGrossEntryModeFeature` method.

The `PX.Objects.CR.NotificationUtility` helper class has been redesigned, and the following method has been removed:

`SearchReport(String, Object, String, Nullable<Int32>)`.

Now each entity that uses this method's functionality has a corresponding `SearchReport` method that has one of the following names:

`SearchVendorReport(...)`, `SearchCustomerReport(...)`, `SearchProjectReport(...)`. The generic `SearchReport` variant can also be used in customisations. The following methods were also removed because they are no longer used:

- `GetSetup(String, String, Nullable<Int32>, Boolean)`
- `GetSource(Object, Guid, Nullable<Int32>)`
- `GetRecipients(Object, NotificationSource)`

The `PX.Objects.AR.ARInvoiceEntry.GetProjectSpecificCustomerReportID(String, ARInvoice, PMProject)` method has been removed because it duplicates the new `SearchProjectReport(...)` method.

The following changes have been made to the printing of AR statements:

- In the `PX.Objects.AR.ARStatementAdjust` and `PX.Objects.AR` namespaces, the `StatementCycleProcessBO` class has been removed.
- In the `PX.Objects.AR.ARPaymentEntry` and `PX.Objects.AP.APPaymentEntry` graphs, the `Adjustments_History` view and the `adjustments_history` delegate has been removed.
- In the `PX.Objects.AR.ARStatementProcess` graph, the `IsEmptyStatement(ARStatement, IEnumerable<ARStatementDetail>, IEnumerable<ARStatementAdjust>)` method has been removed.
- In the `PX.Objects.AR.StatementCycleProcessBO` graph:
 - The `Applications` and `StatementApplications` views have been removed.
 - The following methods have been removed:

- `MarkEmptyStatementsForPrintingAndEmailing(ARStatementCycle, IEnumerable<ARStatement>, IDictionary<ARStatementKey, ICollection<ARStatementDetail>>, IDictionary<ARStatementKey, ICollection<ARStatementAdjust>>)`
- `PersistStatement(StatementCreateBO, IEnumerable<ARStatement>, IEnumerable<ARStatementDetail>, IEnumerable<ARStatementAdjust>)`
- `IsMultipleInstallmentMaster(ARInvoice)`
- `GenerateCustomerStatement(ARStatementCycle, Customer, DateTime, IDictionary<ARStatementKey, ARStatement>, IDictionary<ARStatementKey, ICollection<ARStatementDetail>>, IDictionary<ARStatementKey, ICollection<ARStatementAdjust>>, IDictionary<ARStatementKey, ARStatement>, Boolean)`
- `CombineStatementDetail(ARStatement, ARRegister)`
- `CombineStatementApplication(ARStatement, ARAdjust, String, String)`
- `CombineStatementDetailCustomizable(ARStatement, ARRegister)`
- `CombineStatementApplicationCustomizable(ARStatement, ARAdjust, String, String)`
- `AccumulateAgeBalancesIntoStatements(ARStatementCycle, DateTime, IEnumerable<StatementCycleProcessBO+StatementDocument>, IDictionary<ARStatementKey, ARStatement>, Boolean)`

In the `PX.Objects.AR.AR DunningLetterProcess` class, the bool `addOpenPaymentsAndCreditMemos` parameter has been added to the `CreateDunningLetter()` method to include open credit memos and payments in dunning letters.

The `IsSuspended` field in the `FA DepreciationScheduleItem` class has been removed because it is not needed: The logic does not rewrite the `Suspended` flag of the `FABookHist` class in the `DepreciationCalculation.FillCalculatedHistory()` method.

The constructor signature in the `FAAddition` class has been changed: The decimal `businessUse` parameter has been added to the constructor to fill the `BusinessUse` field correctly.

The abstract `ApplyDispose` method has been added to the `PX.Objects.FA.DepreciationMethods.DepreciationMethodBase` class. If a developer needs to apply disposal logic after calculating depreciation, they should implement the `ApplyDispose` method in a child class. If the developer does not need to apply disposal logic, they should implement the class as empty.

The `EPAApprovalSettings<SetupApproval>` generic class has been refactored to the `EPAApprovalSettings<SetupApproval, DocType>` class to make it possible to work with different entity types: `DocType` and `BatchType`. The signature of the returning type has also been changed.

The optional `dunningFee` parameter has been added to the `ARDunningLetterProcess.CreateDunningLetter()` method.

The `ARDunningLetterProcess.arsetup` view has been renamed to `ARDunningLetterProcess.Arsetup`.

The `GLAnomalyDetectionStatusLink` table has been renamed to `MLStatusLink`. Scale and precision of the `GLTran.MLScore` field have been changed from `decimal(5,4)` to `decimal(8,5)`.

As part of the Zip Codes tab removal from the Tax Zones (TX206000) form, the following changes have been made:

- The `TaxBuilderEngine.GetTaxZoneByZip` method has been removed because it is no longer used.
- The `TaxZoneMaint.Zip` view has been removed because it is no longer used.
- The new `TaxZoneAddressMapping` DAC has been added. It stores new address-based tax zones.
- The `SOOrderEntry.SOShippingAddress_PostalCode_FieldUpdated` event handler has been removed and the `RowUpdated` event handler has been added for `SOShippingAddress`, which is used instead.

The `ARDunningSetup.BaseCuryID` field has been removed because the dunning setup section has been moved to the Customer Classes form. The `ARSetup.ConsolidatedDunningLetter` field has been replaced by the `ARSetup.PrepareDunningLetter` field. Event handlers corresponding to the removed field have also been removed.

The `ARDunningLetter.Consolidated` field has been replaced by the new `ARDunningLetter.ConsolidationSettings` field related to the `ARSetup.PrepareDunningLetter` field.

The `PX.Objects.AR.ARDunningLetterProcess.CreateDunningLetter` field has been modified to use the `consolidationSettings` param (string) instead of `consolidateBranch` (bool).

The `PX.Objects.AR.ARDunningLetterProcess.GetData` method now has no parameter: The system retrieves all required filters from the current instance of the Filter DAC.

The `PX.Objects.AR.ARDunningLetterProcess.ComposeResult` method now gets only the list of dunning letters as a parameter, the system retrieves all required filters from the current instance of the Filter DAC.

The `PX.Objects.AR.ARDunningLetterProcess.CreateDunningLetter` method now also gets required `OrganisationID` parameters and uses the new string `ConsolidationSettings` parameter instead of the original boolean `Consolidated` parameter.

The `PX.Objects.AR.ARSetupMaint.ARSetup_ConsolidatedDunningLetter_FieldUpdated` event handler has been removed, because the corresponding field had already been removed.

The `PX.Objects.AR.ARDunningLetterProcess.MaxDunningLevels` method became private because it is used only inside the graph.

The signature of the following method

```
bool TX.ReportTax.ShowTaxReportLine(TaxReportLine taxReportLine, string
taxPeriodID) has been changed to
bool ShowTaxReportLine(PXResult<TaxReportLine, TaxBucketLine, TaxTranRevReport, CM.Currency>
taxReportLineDetails, string taxPeriodID)
```

because the previous signature did not give access to the extra data which was needed for customisators.

This change has led to changes in the following methods:

- `TX.TaxHistorySumManager.UpdateTaxHistorySums(PXGraph, RoundingManager, String, Nullable<Int32>, Nullable<Int32>, Nullable<Int32>, Func<TaxReportLine, Boolean>)`
- `TX.TaxHistorySumManager.GetPreviewReport(PXGraph, Vendor, Int32, PXResultset<TaxReportLine, TaxHistory>, Func<TaxReportLine, Boolean>)`
- `TX.TaxReportMaint.AnalyseBuckets(PXGraph, Int32, Int32, String, Boolean, Func<TaxReportLine, Boolean>)` In these methods, the type of the `Func<TaxReportLine, Boolean>` `ShowTaxReportLine = null` parameter has been changed to `Func<PXResult<TaxReportLine, TaxBucketLine, TaxTranRevReport, CM.Currency>, bool>` `ShowTaxReportLine = null`

Precision and scale of the GLSetup.Prediction field on the General Ledger Preferences (GL102000) form have been changed from decimal(4,3) to decimal(5,2).

The StringColor class has been removed from the GLTranR DAC because it was unnecessary.

The database fields referencing cash accounts have been renamed as shown in the following table.

Old Field Name	New Field Name
CADepositDetail.AccountID	CADepositDetail.CashAccountID
CashAccountCheck.AccountID	CashAccountCheck.CashAccountID
CashAccountDeposit	CashAccountDeposit.CashAccountID
CashAccountETDetail.AccountID	CashAccountETDetail.CashAccountID
CashAccountPaymentMethodDetail.AccountID	CashAccountPaymentMethodDetail.CashAccountID
PaymentReclassifyProcess.Filter.AccountID	PaymentReclassifyProcess.Filter.CashAccountID

Inventory and Order Management

The following methods have been removed from the PX.Objects.SO.SOPackageDetailEx DAC because the Length, Width and Height fields have been added to the PX.Objects.SO.SOPackageDetail DAC:

- The get_Length() method corresponding to the SOPackageDetailEx.Length field
- The set_Length(Nullable<Int32>) method corresponding to the SOPackageDetailEx.Length field
- The get_Width() method corresponding to the SOPackageDetailEx.Width field
- The set_Width(Nullable<Int32>) method corresponding to the SOPackageDetailEx.Width field
- The get_Height() method corresponding to the SOPackageDetailEx.Height field
- The set_Height(Nullable<Int32>) method corresponding to the SOPackageDetailEx.Height field

The following methods have been removed from the PX.Objects.SO.SOPackageInfoEx DAC because the Length, Width and Height fields have been added to the PX.Objects.SO.SOPackageInfo DAC:

- The get_Length() method corresponding to the SOPackageInfoEx.Length field
- The set_Length(Nullable<Int32>) method corresponding to the SOPackageInfoEx.Length field
- The get_Width() method corresponding to the SOPackageInfoEx.Width field
- The set_Width(Nullable<Int32>) method corresponding to the SOPackageInfoEx.Width field
- The get_Height() method corresponding to the SOPackageInfoEx.Height field
- The set_Height(Nullable<Int32>) method corresponding to the SOPackageInfoEx.Height field

The functionality of the **Multiple Units of Measure** section on the Item Classes (IN201000), Non-Stock Items (IN202000), and Stock Items (IN202500) forms has been refactored from using the INUnitSelect data members to using UnitsOfMeasure graph extensions for better

customisability and supportability. As a result, the classunits and itemunits data members have been moved from the graphs to the appropriate graph extension. The obsolete INUnitSelect class and related classes remain in MYOB Advanced Business 2022.2.1 for backward compatibility of the custom forms that used them before. These obsolete classes will be deleted in future releases.

The following classes have become obsolete:

- PX.Objects.IN.INUnitSelect<Table, inventoryID, itemClassID, salesUnit, purchaseUnit, baseUnit, lotSerClass>
- PX.Objects.IN.INUnitSelect2<Table, itemClassID, salesUnit, purchaseUnit, baseUnit, lotSerClass>

The maintenance of item plans and allocations on the data entry forms has been refactored from using the INItemPlanIDAttribute classes to using the ItemPlan graph extension and its descendants for better customisability and supportability.

The obsolete INItemPlanIDAttribute class and its descendants remain in MYOB Advanced Business 2022.2.1 for backward compatibility of the custom screens that used them before. The obsolete classes will be deleted in future releases.

The following classes and attributes have become obsolete:

- PX.Objects.IN.PlanningHelper<TNode>
- PX.Objects.IN.INItemPlanIDBaseAttribute
- PX.Objects.IN.INItemPlanIDSimpleAttribute
- PX.Objects.IN.INItemPlanIDAttribute
- PX.Objects.IN.INTranSplitPlanIDAttribute
- PX.Objects.IN.INKitTranSplitPlanIDAttribute
- PX.Objects.PO.POLinePlanIDBaseAttribute
- PX.Objects.PO.POLinePlanIDAttribute
- PX.Objects.PO.POLineRPlanIDAttribute
- PX.Objects.PO.PORceiptLineSplitPlanIDAttribute
- PX.Objects.SO.SOLineSplitPlanIDAttribute
- PX.Objects.SO.Attributes.BlanketSOLineSplitPlanIDAttribute
- PX.Objects.SO.SOShipLineSplitPlanIDBaseAttribute
- PX.Objects.SO.SOShipLineSplitPlanIDAttribute
- PX.Objects.SO.SOUassignedShipLineSplitPlanIDAttribute
- PX.Objects.SO.ARTranPlanIDAttribute
- PX.Objects.AM.Attributes.AMProdItemSplitPlanIDAttribute
- PX.Objects.AM.Attributes.AMProdMatISplitPlanIDAttribute
- PX.Objects.AM.Attributes.AMSOLineSplitPlanIDAttribute
- PX.Objects.FS.FSSODetSplitPlanIDAttribute
- PX.Objects.PM.MaterialManagement.ARTranForProjectPlanIDAttribute
- PX.Objects.PM.MaterialManagement.INTranSplitForProjectPlanIDAttribute
- PX.Objects.PM.MaterialManagement.POLineForProjectPlanIDAttribute
- PX.Objects.PM.MaterialManagement.POLineRForProjectPlanIDAttribute
- PX.Objects.PM.MaterialManagement.PORceiptLineSplitForProjectPlanIDAttribute
- PX.Objects.PM.MaterialManagement.POUassignedReceiptLineSplitForProjectPlanIDAttribute
- PX.Objects.PM.MaterialManagement.SOLineSplitForProjectPlanIDAttribute
- PX.Objects.PM.MaterialManagement.SOShipLineSplitForProjectPlanIDAttribute
- PX.Objects.PM.MaterialManagement.SOUassignedShipLineSplitForProjectPlanIDAttribute

In the FAAddition class, the constructor signature has been changed: The businessUse decimal parameter has been added to the constructor to fill the BusinessUse field correctly.

In the `PX.Objects.FA.DepreciationMethods.DepreciationMethodBase` class, the `ApplyDispose` abstract method has been added.

If you need to apply some disposal logic after calculating depreciation, you should implement the `ApplyDispose` method in your child class. Otherwise, if you do not need apply any disposal logic, that is, you should implement an empty method.

Payroll

The `PX.Objects.PR.Task` class name has been changed to `PX.Objects.PR.ProjectTask`.

CRM

The `CRRelationsList` class has been completely redesigned and moved to the `CRRelationDetailsExt` graph extension.

Removed Data Access Classes

This section lists the removed data access classes (DACs)—that is, the classes that implement `PX.Data.IBqlTable`.

Removed Fields, Properties, and Classes

This section lists the public fields, properties, and classes derived from `PX.Data.BQL.BqlType`, `PX.Data.IBqlField` or

`PX.Data.BQL.BqlField<TSelf, TBqlType>` whose visibility has been changed in the code or that have been removed from the code. The list does not include the fields or properties from the deleted and obsolete classes. The list also does not include the fields or properties whose parent classes implement `PX.Data.IBqlTable` or `PX.Data.Constant`.

New PK and FK classes

This section lists the new primary and foreign keys—that is, the public classes that are derived from

`PX.Data.ReferentialIntegrity.Attributes.PrimaryKeyOf` or

`PX.Data.ReferentialIntegrity.Attributes.PrimaryKeyOf<T>.BaseBy<T>.ForeignKeyOf`.
